

Summary

Software Engineer with 5+ years designing Java/Spring backend systems at Amazon, specializing in cross-border financial integrations, distributed event processing, and microservice reliability. Experienced in building transfer pricing and accounting systems using AWS (Lambda, DynamoDB, SNS/SQS, CDK), delivering zero-downtime multi-region migrations, and developing full-stack platforms serving 1500+ users across 35+ teams.

Technical Skills

- **Languages:** Java, Python, SQL
- **Frameworks:** Spring Boot, Spring MVC, Mockito, JUnit
- **AWS Services:** Lambda, SES, RDS, QuickSight, Bedrock, CloudWatch, SQS, SNS, S3, IAM, EC2, API Gateway, CDK
- **Databases:** MySQL, DynamoDB
- **Tools & Practices:** Git, CI/CD, Maven, RESTful APIs, Microservices, Distributed Systems, Event-Driven Architecture, Feature Flags, Unit Testing, Integration Testing, Code Review, Object-Oriented Design, Agile/Scrum

Experience

Amazon 2021 - Present

Bengaluru

Software Development Engineer

- **GenAI Ledger Verification Agent | Python, GenAI Agent, openpyxl, Amazon Ion**
 - Designed and built a GenAI verification agent backed by a deterministic Python engine that recomputes Journal Entry Mapping (JEM) Excel workbooks in-memory and self-tests against cached formula values, pairing golden-truth journal lines to actual General Ledger records and validating 8 accounting segments from both batch Ion output and FLASH integration-test logs
 - Replaced a manual, error-prone accounting sign-off with self-verifying automation across multiple country corridors, and added a deterministic generator that scaffolds cross-border integration tests for new destination countries by editing only two files
- **Cost Component Integration | Java, DynamoDB, AWS SNS, CDK**
 - Designed an event-driven, cross-account transfer-pricing integration service — DynamoDB tables with secondary indexes, Java data-access layer and models with Jackson serialization for SNS message construction, workflow activity with retry and idempotency handling, and a cross-account SNS publisher with feature-flag gating; drove upstream teams to extend their services to emit the additional data the integration required
 - Enabled intercompany transfer processing across 6 country entities, providing item-level cost attribution for tax accuracy and audit traceability
- **EU-Sourcing Accounting System | Java, REST APIs, AWS AppConfig**
 - Designed and built the EU-sourcing accounting booking feature on a multi-stage, event-driven Java processing pipeline, with external REST API integration for business-type classification and financial-ledger configuration rolled out gradually via AWS AppConfig
 - Deployed 9 production releases with scenario-based integration testing across 5 intercompany use cases and 10+ destination corridors, achieving regulatory adherence for cross-border inventory transfers
- **Service Routing Optimization | Java, AWS CDK, SNS, SQS, Lambda**
 - Designed and implemented a direct service-to-service communication layer for a high-scale, distributed transaction system — Java accessor libraries for synchronous order-management APIs and CDK-provisioned SNS/SQS/Lambda infrastructure for asynchronous, event-driven processing
 - Reduced request latency by removing 3 intermediate layers in a scalable transaction system, improving observability and simplifying failure diagnosis
- **Annotation Pipeline Reliability | Java, Spring, DynamoDB, MySQL**
 - Resolved critical production failures across a high-scale, distributed Java/Spring microservice workflow — null-safety checks, batch processing for high-volume DynamoDB operations (4K+ records/call), and boundary validation
 - Improved success rate from 64% to 91% serving millions of users, reducing daily failures from 25 to 0 and closing 18 customer escalations
- **Zero-Trust Authentication Migration | Java, Spring, Multi-Region**
 - Led a zero-trust authentication migration, designing a dual-server pattern for backward compatibility and resolving a Spring-framework protocol incompatibility
 - Migrated 4 microservices with 8 regional deployments (NA, EU, FE, CN) and 7 outbound client connections, delivering zero-downtime cutover and EU Digital Markets Act adherence

- **LLM Automation Validation | Python, Bedrock, Unit Testing**
 - Led 8-member testing team designing process-based validation framework for LLM-generated automation scripts, personally validating 65 documents and reviewing 144 code reviews
 - Built Python automation that cut workspace setup and review-feedback extraction by ~90% (40+ engineer-hours saved), and improved foundation-model accuracy by systematically surfacing hallucinations across 11-12 SOPs tested weekly
- **Annotator Operations Platform | React, Python, AWS Lambda, MySQL, SES**
 - Built a full-stack operations platform — REST APIs, role-based access for 3 user types, scheduled data synchronization, a task-allocation module with Excel ingestion, and a dispute-resolution workflow with automated email notifications
 - Scaled from 800 to 1,500+ annotators across 35 teams / 50+ sub-teams, serving 35-40 managers and replacing manual Excel-based tracking with real-time productivity dashboards
- **Annotation Quality System | Python, AWS Lambda, RDS, QuickSight, REST API**
 - Architected annotation quality measurement system integrating a third-party API, dual statistical analysis engine (custom disagreement algorithm + Krippendorff's Alpha), indexed RDS storage, and interactive QuickSight dashboard
 - Validated thousands of weekly annotations maintaining 80%+ inter-annotator agreement through data-driven insights and targeted training recommendations

Education

JSS Science and Technology University

Bachelor of Engineering in Computer Science and Engineering | CGPA: 8.2/10
